

DataScript: Schema

```
{:name      {:db/unique :db.unique/identity}
 :alias     {:db/unique      :db.unique/value
             :db/cardinality :db.cardinality/many}
 :spouse    {:db/cardinality :db.cardinality/one
             :db/valueType   :db.type/ref}
 :child     {:db/cardinality :db.cardinality/many
             :db/valueType   :db.type/ref}}
```

Entity Attributes

Attributes that establish identity

References create implicit graph relationships

Cardinality: How many

Datascript: Schema

Attributes that establish identity	
Entity Attributes	<code>{:name { :db/unique :db.unique/identity}</code>
	<code>:alias { :db/unique :db.unique/value</code>
	<code>:db/cardinality :db.cardinality/many}</code>
	<code>:spouse { :db/cardinality :db.cardinality/one</code>
	<code>:db/valueType :db.type/ref}</code>
	<code>:child { :db/cardinality :db.cardinality/many</code>
	<code>:db/valueType :db.type/ref}}</code>
References create implicit graph relationships	
Cardinality: How many	

Datascript: Data

```
[{:name "Peter Parker" :gender "M" :alias ["Spider-Man" "Spidey"]}
{:name "Richard Parker" :gender "M" :spouse {:name "Mary Parker"}}
{:name "Mary Parker" :gender "F" :spouse {:name "Richard Parker"}}
{:name "Ben Parker" :gender "M" :spouse {:name "May Parker"}}
{:name "May Parker" :gender "F" :spouse {:name "Ben Parker"}}
{:name "Richard Parker" :child {:name "Peter Parker"}}
{:name "Mary Parker" :child {:name "Peter Parker"}}
{:child [{:name "Ben Parker"}
         {:name "Richard Parker"}]
 :gender "M"}
{:child [{:name "Ben Parker"}
         {:name "Richard Parker"}]
 :gender "F"}]
```

- Data is represented in its natural map form
- The underlying library will deconstruct the maps into datoms
