

# Query Basics

- Basic format is **find-in-where**
- Symbols
  - \$foo refers to a database (you can have many)
  - ?foo refers to the variable ?foo
    - ?foo may or may not be bound
    - ?foo is “unified” across the query, meaning all instances of ?foo refer to the same value
- Example - `[ :find ?name :in $ :where [?e :name ?name]]`

**Example Query:**  
**Who is Peter Parker's Uncle?**
