

Thread Last (->>)

- Each element in the form is successively placed in the last position (just before the closing parenthesis) of the following form.
- Parens are optional for one-argument functions.
- Seq functions (e.g. map, filter, reduce, partition, etc.) adopt the convention (function fn collection), thus seq manipulation is used with ->>.
- Example:

```
(->> 2  
    range  
    (map inc)  
    (filter odd?)  
    first)
```

Thread Last

```
(->> 2  
  (range)  
  (map inc)  
  (filter odd?)  
  (first))
```
